The basic tools in Photoshop are getting better and better. I personally find Darktable to be a big step forward in terms of RAW file support and editing. I have no experience with Darktable, so I can't comment on its various features, but I can say that Photoshop has been built on top of a very strong foundation. I also like Andrew Marlow's review of Darktable in the June issue of Adobe Creative Cuty, so I highly recommend checking out his review and comparison of the two programs. Designing a website isn't one thing. Now that Dreamweaver has a more flexible CSS2 support, it's possible to create a fully-responsive site. In this case, the author created a simple site with various web components that are structured as "sections". Each section has a sidebar and header and a footer. The site is available in Google Static Web Hosting and can be seen in full at ryan-james.net/site/large . This is a static site that will display properly in a web browser, although in limited contexts. What will be interesting to see is what happens with static versioning and responsive design. Dubbed the "ultimate" DNG converter for Mac, Photoshop now automatically performs DNG optimization when you import RAW photos from a camera as well as when you export TIFF or JPEG from other apps. For example, when importing JPEGs from a camera or other app, the application now optimizes the file without you having to do anything. You'll have the option to adjust curves, saturation, contrast, brightness, and white balance. It's a simple way to love-to-hate items, but I can't say I don't approve of it. Still, I think I'll wait until Adobe comes out with an optimized version for Windows and Linux in addition to Mac.
